

Installation:

This Yaris\_Hybrid\_Simulator runs like the origin simulator of Mr. Matsubara with installed Java.

Linux:

Java is in Linux normally installed and there is no extra installation necessary.

After the file is unzipped, there is a file with the ending .jar.  
Click on this file with right click and select „Permissions“ .  
Now set an x to „Allow executing file as program“.

To start the program click with the right mouse button on the file.  
And select „Open With -> OpenJDK Java Runtime“.

Windows:

For starting at windows, you have to install the Java Runtime Engine.

This can be done by clicking on the file and it begins a search in the internet and it can be installed.  
Otherwise you can go to the internet page of the origin simulator and download this runtime engine there.
